

CSE392: Field Training 2 & AIE392: Field Training 2 in AI Engineering

For CSE392: Field Training 2, it should logically move from:

 Learning & reviewing (CSE291)

to

 Application, implementation, and professional practice (CSE392)

Proposed Structure for

CSE392: Field Training 2 in Computer Engineering

And

AIE392: Field Training 2 in AI Engineering

❖ Course Philosophy

Shift from **theoretical exposure and topic exploration (CSE291)** to:

Applied implementation + industry engagement + measurable output

Option 1: Applied Project Based on CSE291 Review (Recommended Model)

Core Idea

The student must **transform the review paper topic from CSE291 into a practical implementation project.**

Required Components

1 Practical Implementation Project

- **Develop a working system, prototype, or simulation.**
- The project must be related to the review topic selected in CSE291.
- Examples:
 - AI topic → build a small ML model or dataset experiment

- Cybersecurity topic → implement a security testing lab
 - Embedded systems → develop hardware prototype
 - Networks → simulate protocol using NS3 or Packet Tracer
-

2 Industrial / Real-World Exposure (Mandatory)

Student must complete one of:

- External company training (minimum ____ hours)
 - Internship in IT/engineering company
 - Participation in funded research lab
 - Industry-supervised applied task
-

3 Technical Documentation

Student submits:

- Technical report (not review — implementation report)
 - Architecture design
 - Code repository (GitHub link mandatory)
 - Testing & evaluation results
-

4 Presentation & Viva

- Demo day presentation
 - Live system demonstration
 - Panel evaluation
-

Option 2: Industry-Oriented Training Model

If you want it more practical and less academic:

Student must:

1. Complete training hours in industry.
 2. Submit:
 - Supervisor evaluation form
 - Daily logbook
 - Final technical report
 3. Develop a small improvement proposal for the host company.
-

Option 3: Research-to-Prototype Model (For High CGPA Students)

For strong students:

- Convert review paper into:
 - Experimental study
 - Research implementation
 - Publishable short paper
 - Encourage submission to:
 - Student conference
 - Undergraduate research journal
-

Recommended Best Academic Structure

Since you are in Computer Science & Engineering, the strongest curriculum design is:

- ◆ CSE291 → Topic exploration + review + course skill
- ◆ CSE392 → Applied project + industry exposure + system implementation

That creates:

- Research thinking
 - Practical engineering skills
 - Portfolio building
 - Industry readiness
-
